ContainerPower Energy Solutions

Communication base station inverter grid connection change

Overview

How do solar inverters connect to the grid?

Solar inverters connect to the grid through a process known as grid synchronization, which involves aligning the inverter's output voltage, frequency, and phase with the grid's parameters. Once synchronization is achieved, the inverter closes its output contactors, allowing bidirectional power flow between the solar power system and the grid.

What are the characteristics of different communication methods of inverters?

The characteristics of different communication methods of inverters are obvious, and the application scenarios are different. In order to better weave the underlying network of energy digitization and intelligent development, choose the most appropriate communication method according to local conditions.

How does a solar inverter synchronize with the grid?

In this method, a device called a "synchroscope" helps the solar inverter synchronize with the grid. The synchroscope displays the phase difference between the solar system and the grid. When both systems are in phase (i.e., synchronized), a rotating disc on the synchroscope aligns with a fixed reference mark.

Why should you use a shielden grid-tied inverter?

Shielden grid-tied inverter can provide excellent experience for grid synchronization. Working closely with experienced solar installers and system integrators can help stakeholders navigate the complexities of grid synchronization and maximize the reliability and performance of their solar installations.

How does an inverter work?

The inverter adjusts its output until all three lights turn off. This happens when

the phase difference between the inverter and the grid reaches zero, achieving balance in the current across the lights, which turns them off. This “off” state indicates that the inverter is synchronized with the grid.

How does a low voltage inverter work?

The data signal is connected to the low-voltage busbar through the power line on the AC side of the inverter, the signal is analyzed by the inverter supporting the data collector, and the communication is finally connected to the local power station management system or the cloud platform through the LAN or the Internet 2. Application scenario 4.
