In this article, we will explore cutting-edge new battery technologies that hold the potential to reshape energy systems, drive sustainability, and support the green transition.

We systematically compare and evaluate battery technologies using seven key performance parameters: energy density, power density, self-discharge rate, life cycle, charge-discharge efficiency, operating range, and overcharge tolerance.

This review offers a quantitative comparison of major ESS technologies mechanical electrical electrochemical thermal and chemical storage systems assessing them for energy density, scalability, efficiency, longevity and integration compatibility with renewable energy systems.

The development of electrochemical energy storage systems shows the continuous path from simple, non-rechargeable cells to the highly complex lithium-ion systems of today.
