

## ContainerPower Energy Solutions

# Flow battery dedicated inverter

## Overview

---

What is a multi flow inverter?

**Inverter** The inverter controls the energy flows in the storage system. Multi Flow Technology allows simultaneous energy flows in all directions, which means less grid usage and less feed-in – i.e. lower costs and a higher yield.

Are flow batteries intrinsically linked?

Because of the specific technology, stored energy in and power supplied by flow batteries are not intrinsically linked. This feature makes them especially suitable for storage systems for renewables, especially for uses with long discharge times.

Is a flow battery safer than a lithium ion battery?

In terms of safety, a flow battery has an operating system with fewer critical issues to manage than a lithium ion battery, which needs several control systems to avoid harmful overloading and overheating. Because of the specific technology, stored energy in and power supplied by flow batteries are not intrinsically linked.

Are flow batteries sustainable?

Storage systems with flow batteries are built from raw materials with higher availability and less environmental impact than their lithium cousins, making them more sustainable.

How does a PV inverter work?

If there is a surplus, loads are supplied and the battery is charged in parallel. When there is a consumption situation, power is supplied by the PV generator and the battery. 4. Additional AC source The inverter can use energy from an additional AC source to charge batteries, for example, from wind turbines or existing PV systems. 5. Inverter.

What are the advantages of Fronius multi flow inverters?

Conventional inverters only allow one energy flow at a time; simultaneous current flows are not possible. This means the energy generated is not used optimally. Fronius inverters with Multi Flow Technology can control different energy flows in parallel and in all directions. This has many advantages. 1. Photovoltaic generator
