# Grid-connected inverter prices are inflated

## Overview

---

The average electricity rate in June of 2025 was 6.7% higher than the rate in the same month in 2024, resulting in residential electricity prices rising more than twice as fast as the overall consumer price inflation in the United States during that time period.

With increasing electricity demand and growing production from wind and solar power, FERC has approved standards requiring wind and solar generators to stay connected during disturbances, boosting grid stability amid increasing inverter-based power sources. The requirement for increased utility.

The grid-forming inverter market may soon inflect from \$1bn to \$15-20bn pa, to underpin most grid-scale batteries, and 20-40% of incremental solar and wind. This 11-page report finds that grid-forming inverters cost c\$100/kW more than grid-following inverters, which is inflationary, but integrate.

Load growth and aging infrastructure require investment, but customer electricity prices are up 4.5% nationally, almost twice the 2.4% national inflation rate. High voltage power lines run along the electrical power grid on May 16, 2024, in Pembroke Pines, Florida. Utilities need to invest in grid.

An IEA survey of industry leaders found that procurement now takes two to three years for cables and up to four years for large power transformers – twice as long as in 2021. Specialised components face even longer delays, with lead times for direct current cables – often used for long-distance.

Grid connected inverters play a core role in the process of renewable energy grid connection, but with the rapid development of the industry, a series of pain points have gradually emerged, restricting their further promotion and application. Thoroughly analyzing these pain points and exploring.

Electricity price increases reflect economy-wide inflation. Across the economy, prices have risen by nearly 20 percent since the beginning of 2021.<sup>2</sup> As prices have risen across the economy, so have the rates consumers pay for electricity. With utilities asking their regulators to approve record.
