How big a battery does a 3kw inverter need

Overview

You need 4 Lithium batteries in series to run a 3,000W inverter. If you use lead-acid batteries, you need 12 batteries with 4 in series and 3 strings in parallel. How many batteries do I need for a 3000 watt inverter?

The number of batteries required for a 3000 watt inverter depends on the ampere per hour (AH) and rated voltage (V) of the battery you purchased, as well as the effective working capacity. These parameters can usually be clearly found on the battery casing. First, Junchipower will tell you the core formula for calculating the number of batteries:

How much power does a 3000W inverter use?

A 3000W inverter at 48V draws ~70A—ensure your battery supports this. Real-world example: A 48V 200Ah LiFePO4 battery delivers 9.6kWh usable energy. At 3,000W, runtime is ~3.2 hours. Transitioning to runtime needs, how does voltage affect sizing?

Higher voltages (e.g., 48V vs. 12V) reduce current, minimizing heat and wiring costs.

Can a 3000W inverter run a solar system?

When setting up a solar power system with a 3000W inverter, one of the key considerations is choosing the right battery size to ensure a reliable and consistent energy supply. Whether you're powering your home, an RV, or an off-grid cabin, the battery capacity directly affects how long your inverter can deliver power.

What is the recommended battery size for an inverter?

Interpreting Results: Once you input the required data, the calculator will generate the recommended battery size in ampere-hours (Ah). For instance, if your power consumption is 500 watts, the usage time is 4 hours, and the inverter efficiency is 90%, the calculator might suggest a battery size of approximately 222 Ah.

Which battery is best for a 1000 watt inverter?

Lead-acid batteries have a C-rate of 0.2C, while lithium (LiFePO4) batteries have a higher C-rate of 1C. 12V for inverters below 1000W. 24V for 1000-2000W inverters. 48V for 2000-4000W inverters. We need to satisfy two criteria before we can tell you what battery you need. These are:.

How much power does an inverter need?

That is, the power required for the actual operation of the inverter is: $\text{inverter rated power} / 85\% = \text{actual power}$. For example, if a 3000-watt inverter wants to run at full power, the battery output power needs to be 3529 W.
