# How big are the solar panels at the island station

## Overview

---

The ISS has eight large solar arrays, each measuring 73 meters in length and weighing approximately 1,500 kilograms. How many solar panels does the International Space Station have?

The International Space Station has 8 solar array wings with a total of 262,400 solar cells. The solar arrays cover an area of 27,000 square feet (2,500 square meters), more than half the size of a football field. Each solar array wing has a wingspan of 240 feet (73 meters), longer than a Boeing 777 aircraft.

How do solar panels work on the International Space Station?

The solar arrays on the International Space Station (ISS) have a special design. They use many small rectangles of solar cells. This way, they can get the most sunlight and make a lot of power. They cover almost all the space that can see the Sun. The solar cells on the ISS are made for space.

How many solar panels are on the ISS?

The International Space Station (ISS) is a unique scientific platform that enables researchers from all over the world to put their talents to work on innovative experiments that could not be done anywhere else. There are 32,800 solar cells total on the ISS Solar Array Wing, assembled into 164 solar panels. Shadows cold, sunshine hot.

When will solar panels be installed on the International Space Station?

Launched on June 6, 2023. Installed on June 9 and 15, 2023. The roll-out solar arrays augment the International Space Station's eight main solar arrays. They produce more than 20 kilowatts of electricity and enable a 30% increase in power production over the station's current arrays.

How big is the International Space Station?

The International Space Station is larger than a six-bedroom house with six sleeping quarters, two bathrooms, a gym, and a 360-degree view bay window.

The crew is installing new IROSAs, or International Space Station Roll-Out Solar Arrays, to augment the orbiting lab's eight main solar arrays.

How many solar cells are in a space station?

The space station's solar arrays contain a total of 262,400 solar cells and cover an area of about 27,000 square feet (2,500 square meters) — more than half the area of a football field. A solar array's wingspan of 240 feet (73 meters) is longer than a Boeing 777's wingspan, which is 212 feet (65 meters).
