How many kilowatts of solar panels should be installed at home

Overview

For many homes, a 1 kilowatt (kW) solar system hits the sweet spot. This typically involves installing 2-4 solar panels, depending on their individual wattage. How many solar panels do you need to power a house?

The goal for any solar project should be 100% electricity offset and maximum savings — not necessarily to cram as many panels on a roof as possible. So, the number of panels you need to power a house varies based on three main factors: In this article, we'll show you how to manually calculate how many panels you'll need to power your home.

How many kW solar panels do I Need?

As we calculated earlier, the California household needs a 7.2 kW system to cover its electricity needs. A comparable household in Massachusetts needs a 9.9 kW system. So, in less sunny areas like Massachusetts, you might consider choosing highly efficient solar panels to maximize your energy output per square foot.

How many solar panels do I need for a 5kW system?

If you are using only 400-watt solar panels, you will need 13 400-watt solar panels for a 5kW solar system (13 × 400 watts is actually 5200 watts, so this is a 5.2kW system). Quite simple, right?

You can also mix solar panels with different wattages.

How much space do solar panels need?

Each solar panel requires approximately 17-20 square feet of roof space, including necessary spacing for installation and maintenance. A typical 20-panel system needs 340-400 square feet of unshaded roof area. If your primary roof area is unsuitable, consider: Solar panel efficiency directly affects the number of panels needed:.

How much power does a solar panel use?

Solar panel power ratings range from 250W to 450W. Based on solar.com sales data, 400W is the most popular power rating and provides a great balance of output and Price Per Watt (PPW). If you have limited roof space, you may consider a higher power rating to use fewer panels. If you want to spend less per panel, you may consider a lower wattage.

What wattage should a solar panel be?

The higher the wattage, the more power a panel can generate. Most residential solar panels have ratings of 250 to 400 watts. The most efficient solar panels on the market are 370- to 445-watt models. The higher the wattage rating, the higher the output. In turn, the fewer panels you might need.
