

## ContainerPower Energy Solutions

# How many solar panels are suitable

## Overview

---

The average home needs between 15 and 19 solar panels to cover its daily electric usage. You can use annual energy use for a more accurate estimate of how many solar panels your house needs. How many solar panels should a home have?

With enough available installation space, most residential solar power systems consist of 15 to 25 panels, depending on energy demand, home size, and other factors. Can you put too many solar panels on a home?

Are 20 solar panels a lot?

No, 20 solar panels are not really “a lot,” and the amount may be suitable for your home. With enough available installation space, most residential solar power systems consist of 15 to 25 panels, depending on energy demand, home size, and other factors.

How many kW solar panels do I Need?

As we calculated earlier, the California household needs a 7.2 kW system to cover its electricity needs. A comparable household in Massachusetts needs a 9.9 kW system. So, in less sunny areas like Massachusetts, you might consider choosing highly efficient solar panels to maximize your energy output per square foot.

How much electricity does a solar system use a month?

It depends on usage, not square footage, but most 2,000 sq ft homes use about 1,000–1,200 kWh per month, which equals about 17–20 panels (400W panels, 5 sun hours). Can solar cover your entire electric bill?

Yes. If your system is sized correctly, solar can offset 100% of your electricity use, especially with net metering.

How much energy does a solar panel produce?

A solar panel's wattage has the biggest impact on how much energy it produces. An average 400-watt monocrystalline solar panel will produce 2 kWh of energy per day. Solar panels with higher efficiency ratings will generally have higher wattages and are best for homes with limited roof space.

Should I add more solar panels to my home?

As you plan your solar panel system, consider any anticipated increases in your home's energy demands. Although it may be possible to add more panels later for extra costs, overcompensating for additional electricity use can help maximize your long-term solar return on investment by avoiding future labor and permitting expenses.
