# Lithium iron phosphate battery energy storage export

**FLEXIBLE SETTING OF  
MULTIPLE WORKING MODES**

## Overview

---

China's Ministry of Commerce has proposed restricting the export of technologies for producing lithium iron phosphate (LFP), an inexpensive cathode material for electric vehicle batteries.

China's Ministry of Commerce has proposed restricting the export of technologies for producing lithium iron phosphate (LFP), an inexpensive cathode material for electric vehicle batteries.

Beijing has added battery cathode material preparation technology to its restricted export list. The move affects lithium iron phosphate (LFP) and related technologies, requiring export licences to balance development and security. The new restriction covers preparation technologies for battery.

China's recent decision to restrict exports of lithium iron phosphate (LFP) and lithium manganese iron phosphate (LMFP) battery cathode active material technology is more than just a trade move, or only the latest play in an escalating geopolitical game of tariffs and counter-tariffs. It's nothing.

Batteries are a key pillar within the global push for sustainability, powering everything from EVs to renewable energy storage systems. Semiconductors, wind turbines, solar panels and hydropower technologies also play key roles, but batteries stand out as critical enablers of the transition to.

China has outlined plans to restrict exports of key technologies used in lithium refining and electric battery chemical production. The proposal by China's Ministry of Commerce, currently open for public feedback and open to change, includes specific technologies, such as: The export restrictions.

At the heart of this global industry lies China, which dominates the export of battery technologies and the materials required to produce them. However,

China's control over the sector is under increased scrutiny. The Chinese Ministry of Commerce recently proposed restrictions on exporting.
