Netherlands New Energy All- vanadium Liquid Flow Battery

Overview

NARI has successfully developed a 32kW battery stack and 50kW, 100kW and 250kW all-vanadium liquid flow battery energy storage modules, which can be widely used in various links such as power generation, transmission, transformation, distribution and consumption. Why are vanadium redox flow battery systems important?

Battery storage systems become increasingly more important to fulfil large demands in peaks of energy consumption due to the increasing supply of intermittent renewable energy. The vanadium redox flow battery systems are attracting attention because of scalability and robustness of these systems make them highly promising.

When were vanadium flow batteries invented?

In the 1980s, the University of New South Wales in Australia started to develop vanadium flow batteries (VFBs). Soon after, Zn-based RFBs were widely reported to be in use due to the high adaptability of Zn-metal anodes to aqueous systems, with Zn/Br₂ systems being among the first to be reported.

Why does a vanadium electrolyte deteriorate a battery membrane?

Exposure of the polymeric membrane to the highly oxidative and acidic environment of the vanadium electrolyte can result in membrane deterioration. Furthermore, poor membrane selectivity towards vanadium permeability can lead to faster discharge times of the battery. These areas seek room for improvement to increase battery lifetime.

Why do flow battery developers need a longer duration system?

Flow battery developers must balance meeting current market needs while trying to develop longer duration systems because most of their income will come from the shorter discharge durations. Currently, adding additional energy capacity just adds to the cost of the system.

What is all vanadium redox flow battery (VRB)?

All vanadium RFB principles The all Vanadium Redox Flow Battery (VRB), was developed in the 1980s by the group of Skyllas-Kazacos at the University of New South Wales , , , .

Can polymeric membranes be used in vanadium redox flow batteries (VRB)?

This review on the various approaches to prepare polymeric membranes for the application in Vanadium Redox Flow Batteries (VRB) reveals various factors which should be considered when developing new membranes materials with or without the addition of non-polymeric materials.
