This paper presents a novel load frequency control (LFC) strategy for energy storage system (ESS)-integrated power systems, leveraging interval type-2 (IT-2) fuzzy logic and an adaptive integrated event-triggered scheme (AIETS). The proposed IT-2 fuzzy LFC addresses the nonlinearities in governor.

One of the critical aspects of grid stability is frequency regulation, which involves maintaining the grid frequency within a narrow range to ensure reliable operation of the power system. Energy storage has emerged as a crucial component in frequency regulation, providing a flexible and responsive.

This shift has elevated energy storage systems (ESSs) from supportive infrastructure to a central pillar in grid frequency regulation—a role previously dominated by conventional rotating machinery. Frequency Instability: A Consequence of High Renewable Penetration As synchronous generators give way.
