Sodium-ion batteries are a type of rechargeable batteries that carry the charge using sodium ions (Na⁺). The development of new generation batteries is a determining factor in the future of energy storage, which is key to decarbonisation and the energy transition in the face of the challenges of.

Sodium ranks sixth in abundance in the Earth's crust, over a thousand times more abundant than lithium, making its raw material, battery-grade sodium carbonate, maintain a price of around \$740 per ton compared to lithium carbonate, which can hit highs of \$94,000 per ton. Moreover, the widespread.

Proponents say sodium-ion batteries degrade more slowly, operate more efficiently and have lower fire risk. But high-profile failures cloud the U.S. market. Denver-based Peak Energy powered up what it says is the United States' first grid-scale sodium-ion battery installation. Courtesy of Peak.
