Solar panel output value

Overview

Solar panels degrade slowly, losing about 0.5% output per year, and often last 25–30 years or more. Most residential panels in 2025 are rated 250–550 watts, with 400-watt models becoming the new standard. A 400-watt panel can generate roughly 1.6–2.5 kWh of energy per day, depending on local sunlight.

Solar panels degrade slowly, losing about 0.5% output per year, and often last 25–30 years or more. Most residential panels in 2025 are rated 250–550 watts, with 400-watt models becoming the new standard. A 400-watt panel can generate roughly 1.6–2.5 kWh of energy per day, depending on local sunlight.

Here is the formula of how we compute solar panel output: $\text{Solar Output} = \text{Wattage} \times \text{Peak Sun Hours} \times 0.75$ Based on this solar panel output equation, we will explain how you can calculate how many kWh per day your solar panel will generate.

Most solar panels on the market today produce between 250 and 400 Watts of power. Individual energy consumption, location, system size, and panel efficiency all significantly impact generation.

Solar panel output measures the electricity a solar panel produces from sunlight. It's expressed in watts or kilowatt-hours (kWh) and directly impacts your energy savings.
