# Wind power generation impacts power systems

## Overview

---

Wind power can provide voltage control and active power (frequency) control. Wind power plants can also reduce transmission and distribution losses when applied as embedded generation. On the system-wide scale, there are other aspects to consider.

The impacts of wind power in the electricity system depend to a large extent on the: Generation mix of electricity in the system. Wind energy penetration at low to moderate levels is a matter of cost, as demonstrated by various national and regional integration studies. And the integration costs.

AB - Wind energy is currently one of the cheapest renewable energy technologies and plays a central role in many countries' climate and energy strategies. However, like any electricity-generation technology, wind energy affects and interacts with the broader environmental, social, economic.

Power systems are complex systems that evolve over years in response to economic growth and continuously increasing power demand. With growing populations and the industrialization of the developing world, more energy is required to satisfy the basic needs and to attain improved standards of human.

Wind and solar are the predominant sources of power generation in the Net Zero Emissions by 2050 Scenario, but annual wind capacity additions until 2030 need to increase significantly to be on track with the Net Zero pathway. Where do we need to go?

Reaching the levels of annual wind electricity.
